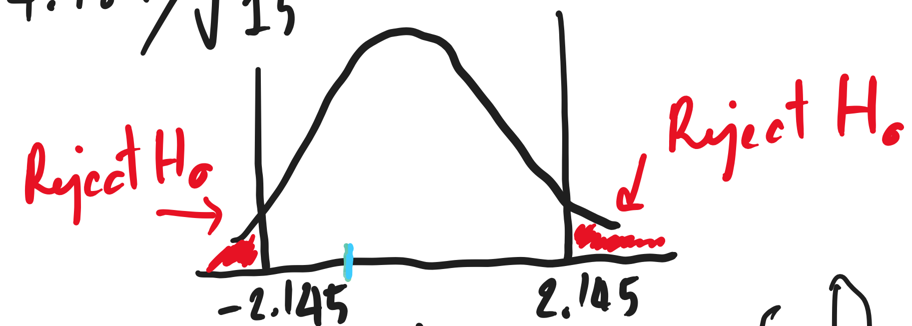
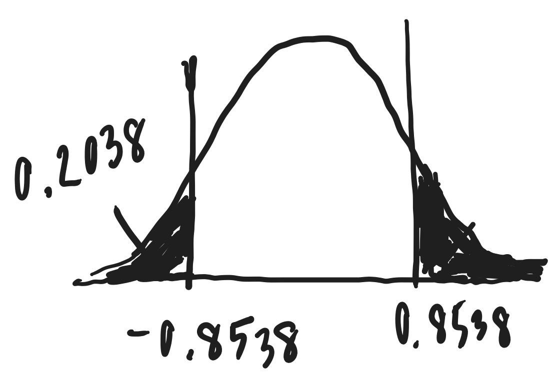
μ : The mean number of hours that the students spend on Statcrunch per week.

1. $H_0 : \mu = 7$
   $H_1 : \mu \neq 7$
2. $\alpha = 0.05$
3. $t_{cal} = \dfrac{\bar{X} - \mu_0}{s/\sqrt{n}} = \dfrac{5.9 - 7}{4.989/\sqrt{15}} = -0.8538$
4. $t_{0.025,14} = 2.145$



5. The t_{cal} falls outside the critical region. (Do not reject H_0)
There is not enough evidence to say that the mean number of hours that the students spend on Statcrunch per week is different from seven hours.

4. P-value



P-value $= 2 \times 0.2038 = 0.4076$

P-value $> \alpha$ $\therefore$ Do not reject H_0
